# Track Controller Release Notes

## Version 5.9.0

### Introduction

The new firmware improves the Track Controller experience with smoother, more seamless operation. This document covers the updates introduced since version 5.7.0.

### Improvements

- **More reliable operation during intensive fieldwork.** In previous versions, the Track Controller could occasionally become unresponsive during demanding conditions — for example, when multiple implements, sensors, or ISOBUS devices were active simultaneously on the CAN bus. This update eliminates those lockups, so the unit now stays responsive, even under heavy network traffic.
